

For Immediate Release

Voyantic Tagsurance UHF Tester Enables HID Global to Deliver Optimized High Quality UHF Tags

The RFID market has learned the value of consistent high quality of supplied tags after having faced some reliability issues in the early phases of UHF RFID deployment. End users and solution providers have become aware of this fact and the quality requirements for UHF RFID tags have increased. As the requirements for each application differ, the production test systems need to be flexible and also provide superior testing capabilities for the most technologically advanced products.

Voyantic is proud to relay that HID Global has deployed the Tagsurance UHF tester in their production facility following successful tests in their R&D and quality labs.

The Tagsurance UHF tester from Voyantic Ltd. not only tests the functionality of the tag on reader frequency, but is also capable of testing the tags on a wide frequency range. This allows the supplier to perform application specific testing based on the tuning level in the end application. The Tagsurance also gathers process capability data by actually measuring the tag performance at production speed. Based on the data provided by Tagsurance, in-house production processes can be comprehensively analyzed and constantly monitored and improved.

HID Global, with over two decades of RFID development and manufacturing experience, offers the industry's most diverse and flexible line of RFID tags and transponders. As a trusted source for secure identity solutions, HID Global has built a reputation based on quality, which the Voyantic Tagsurance plays an important role in assisting them to continually deliver. Previous positive experiences with the Voyantic measurement solutions and their ease of use in the lab made the choice of Voyantic testing equipment for the production environment an easy decision.

Eric Suligoj, Director of Business Development Industry & Logistics, Identification Technologies at HID Global, is very pleased with the test system: "The Tagsurance UHF tester has been implemented in our production facility at HID Global last year. We use this product to test our UHF tag products in their final phase of production. We were surprised by its speed of measurement. Minimizing the time taken to test each tag is an important factor during the quality control process given the volumes of tags we produce daily. But more importantly, this tester delivers accurate characterization data we haven't had access to before. This will enable us to fine tune our processes and continue to deliver best-in-class UHF tag products."

About Voyantic Ltd.

Voyantic provides RFID testing and measurement solutions, including Tagformance UHF RFID system and Tagsurance UHF Tester. The company has delivered well over 150 solutions to the leading tag manufacturers, tag designers, research institutes and test centers. Headquartered in Finland, Voyantic serves customers on four continents through distributors and direct sales.
